FOREWORD

The current resurgence of interest in the study of the ionosphere-thermosphere system is, to a significant degree, due to the development and improvement of experimental and analysis techniques. These include space-borne as well as ground-based systems, carrying out either *in situ* or remote sensing measurements, actively or passively, using a significant fraction of the electromagnetic spectrum. Innovations are found not only in hardware, but also in methods of analysis and simulations. During the period of WITS, it was recognized that a Handbook dedicated to state-of-the-art technical information would be most useful to help workers in the field keep abreast of new developments. To this end, recognized experts have been invited to contribute chapters on their specialities, covering such aspects as instrumentation, technical principles, data analysis, and capabilities. Due to space limitations it has not been possible to cover all topics exhaustively. It is hoped that future volumes dedicated to techniques will be published.

I would like to thank all the contributors for their tremendous effort and cooperation. Special thanks are also due to Mrs. Belva Edwards for her editorial help.

C. H. Liu

Table of Contents

Chapter		Page
1.	Use of ground-based magnetometers to infer the dynamics of magnetosphere-ionosphere coupling and the solar-terrestrial interaction, <i>G. Rostoker</i>	1
2.	"In situ" measurement techniques for ionospheric-thermospheric investigations, <i>E. P. Szuszczewicz</i>	44
3.	Prospects of topside sounding, <i>S. A. Pulinetz</i>	99
4.	Scintillation technique for probing ionospheric irregularities, <i>Sa. Basu and Su. Basu</i>	128
5.	Modern total electron content measurement techniques, <i>J. A. Klobuchar</i>	137
6.	Rayleigh and sodium lidar techniques for measuring middle atmosphere density, temperature and wind perturbations and their spectra, <i>C. S. Gardner, D. C. Senft, T. J. Beatty, R. E. Bills, and C. A. Hostetler</i>	148
7.	Upper atmospheric wind and temperature measurements using imaging Fabry-Perot interferometers, <i>D Rees, I. McWhirter, A. Aruliah, and S. Batten</i>	188
8.	Spectrometric measurement techniques of weak emissions in twilight airglow, <i>C. A. Tepley</i>	224
9.	Optical and radar techniques applied to chemical research "active experiments" in the ionosphere/thermosphere system, <i>M. Mendillo, J. Baumgardner, and P.J. Sultan</i>	250
10.	Modification of the ionosphere as a method of its diagnostics, <i>L. M. Erukhimov and N. A. Mityakov</i>	267
11.	Coherent radar techniques, <i>E. Nielsen</i>	285
12.	Remote sensing of the high latitude ionosphere with coherent scatter HF radar: A review of the technique and recent work, <i>J. M. Ruohoniemi, R. A. Greenwald, and K. B. Baker</i>	319
13.	The digisonde 256 ionospheric sounder, <i>B. W. Reinisch, K. Bibl, D. F. Kitrosser, G. S. Sales, J. S. Tang, Z.-M. Zhang, T. W. Bullett and J. A. Ralls</i>	350
14.	The HF Doppler technique for monitoring transient ionospheric disturbances, <i>T. B. Jones</i>	383
15.	Theoretical and simulation methods applied to high latitude, F region turbulence, <i>J. D. Huba</i>	399
16.	The derivation of meridional neutral winds in the thermosphere from F2-layer height, <i>K. L. Miller, P. G. Richards, and D. G. Torr</i>	439
