FOREWORD

This is a second volume of cosmic-ray publications which, we trust, will remain in scientific libraries throughout the world as a monument to the sustained cooperative efforts of a group of men with warm and lasting interest in the phenomena of geophysics. The elusive origins of the very high-energy radiations which come to our atmosphere from unknown reaches of space have not been satisfactorily delineated by theory or by experiment, as yet. Because the orbits of charged particles are so comprehensively changed by their encounter with the magnetic field of the earth, directions of arrival of these radiations do not appear to be reliable indicators of the origins of the particles. Time variations of the radiations, however, suitably interpreted, may give some firm indications of the mechanisms in space which yield radiations of such enormous energies as are observed in cosmic-ray work. This was the expectation more than two decades ago when the world network of cosmic-ray observing stations was set up by the Carnegie Institution at the request of the late Professor R. A. Millikan, Professor A. H. Compton, and the late Dr. J. A. Fleming, who died in midsummer 1956. This volume presents in detail the data obtained at the Instituto Geofísico de Huancayo, Huancayo, Peru, and at the station operated by the U. S. Coast and Geodetic Survey at Cheltenham, Maryland. The Cheltenham instrument was moved to the new U. S. Coast and Geodetic Survey station near Fredericksburg, Virginia, in October 1956. The data obtained at Christchurch, New Zealand, and at Godhavn, Greenland, are summarized in this volume.

The principal guidance for these studies has been in the hands of Scott E. Forbush of this Department, and a great deal of the technical computation and analysis has been carried out by Miss Isabelle Lange, with assistance from Mrs. Liselotte Beach. The faithful work of the several observers in the operation and maintenance of the cosmic-ray meters at the institutions mentioned was of course a foundation on which this work rests. Grateful acknowledgment is made to the Instituto Geofísico de Huancayo and its Director, Dr. A. A. Giesecke, Jr., for providing records from that station. These were obtained with equipment transferred as part of the Huancayo Magnetic Observatory by gift of the Department of Terrestrial Magnetism to the Peruvian Government on July 1, 1947. Special acknowledgment is due the staff of the Christchurch Magnetic Observatory for having scaled all the hourly cosmic-ray records at that station since April 1936.

The Carnegie Institution is happy to have the privilege of publishing this joint volume for the various institutions concerned.

M. A. Tuve, Director
Department of Terrestrial Magnetism
Carnegie Institution of Washington

PREFACE

The installation, operation, and maintenance of the four Compton-Bennett ionization chambers which provided the data for this volume would have been impossible without the enthusiastic co-operation of several organizations and individuals. To the Instituto Geofísico de Huancayo and its Director, Albert A. Giesecke, we are grateful for making available the records from Huancayo. These were obtained with equipment belonging to the Huancayo Magnetic Observatory, which was transferred July 1, 1947, by gift of the Department of Terrestrial Magnetism to the Government of Peru. We express our appreciation to the Director of the U. S. Coast and Geodetic Survey for providing space for the meter at the Cheltenham Magnetic Observatory, and to the members of the staff of that observatory for efficient operation and maintenance of the equipment. Grateful acknowledgment is also made to the Director of the U.S. Coast and Geodetic Survey for providing a building for the cosmic-ray meter at its new Fredericksburg (Virginia) Magnetic Observatory and to the observer in charge there, Robert E. Gebhardt, for transferring the meter from Cheltenham in October 1956. We acknowledge the co-operation of the Director, Magnetic Survey Division, Department of Scientific and Industrial Research of New Zealand, for making available the facilities of the Geophysical Observatory at Christchurch; and to the Director and staff of that observatory we are particularly grateful, not only for efficient operation and maintenance of the meter, but also for scaling all the hourly cosmic-ray records for that station since April 1936. We also wish to thank the Director, Det Danske Meteorologiske Institut, and the Director and staff of its Geofysisk Observatorium at Godhavn, Greenland, for the effective operation and maintenance of the meter there. Grateful acknowledgment is made to the Government of Denmark for transportation of equipment and supplies to Godhavn.

Isabelle Lange and S. E. Forbush
Department of Terrestrial Magnetism

COSMIC-RAY RESULTS FROM HUANCAYO, PERU; CHELTENHAM, MARYLAND; CHRISTCHURCH, NEW ZEALAND; AND GODHAVN, GREENLAND

INTRODUCTION

Volume XIV of Researches of the Department of Terrestrial Magnetism (Carnegie Institution of Washington Publication 175) contained cosmic-ray data from Huancayo, Cheltenham, Christchurch, and Godhavn through 1946. The present volume includes data subsequently obtained through 1955 from Huancayo, Cheltenham, and Christchurch; and through 1950 from Godhavn. Volume XIV also contained summaries of data for all four stations, and bihourly mean values for Huancayo. The present volume extends the summaries for all four stations and in addition includes not only bihourly mean values from Huancayo for the period January 1946 through December 1955, but also bihourly mean values from Cheltenham for the period March 1936 through December 1955.

Volume XIV described a typical installation, the instrument used, the absolute values of ionization, and procedures for reduction of the data. It also gave the geographical co-ordinates, the altitude, and the geomagnetic latitude of the stations.

REDUCTION OF DATA

For Huancayo the data in the present volume were reduced as described in detail in Volume XIV, except that after 1945 no IBM (International Business Machines) equipment was available to facilitate the reductions. The barometric coefficients used throughout are those given in Volume XIV.

The barometric pressure data for Huancayo were from an ordinary Richard barograph, and those for Christchurch were from a microbarograph. For Godhavn and Cheltenham the corrections for barometric pressure were scaled directly from the trace of the recording aneroid barometer on the cosmic-ray record.

Since installation of the meters at Huancayo and Cheltenham, the argon pressure at 15°C has remained constant through 1955 at 740 and 700 lbs. in.$^{-2}$, respectively. For Christchurch the argon pressure at 15°C has remained constant through 1955 at 740 lbs. in.$^{-2}$ since November 10, 1938; and at Godhavn it has stayed constant from September 1944 through 1955 at 580 lbs. in.$^{-2}$. For Godhavn all departures from balance have been normalized to argon pressure 700 lbs. in.$^{-2}$.

It is important to note that all data in the present volume, as in Volume XIV, are corrected only for barometric pressure. No other meteorological corrections have been applied. Consequently, seasonal waves are present in the data for all stations, except perhaps Huancayo. In addition, the data at all stations except Cheltenham indicate slow changes in the background intensity. These instrumental drifts and seasonal variations are described in "World wide cosmic-ray variations, 1937-1952," Journal of Geophysical Research, vol. 59, no. 4, December 1954, pp. 525-542.

DESCRIPTION OF TABLES

Huancayo Magnetic Observatory

Tables 1-120.—Monthly tables for the period January 1946 through December 1955 contain bihourly mean values of departure from balance, corrected to 510 mm Hg. Bihourly mean values are centered at the indicated 75th west meridian hours for Tables 1-108 (January 1946 through December 1954) and at the indicated Greenwich mean hours for Tables 109-120 (January through December 1955). Tabular values are in units of 0.1 per cent of total cosmic-ray ionization, with 6.0 per cent added.

Tables[1] 121-130.—Annual tables for the period 1946 through 1955 contain daily means of hourly departures from balance, corrected to 510 mm Hg. Tabular values, by months, are in units of 0.1 per cent of total cosmic-ray ionization with 6.0 per cent added. Superscripts a to k indicate the number of missing bihourly values 1 to 11, respectively.

Tables[1] 131-140.—Annual tables for the period 1946 through 1955 contain bihourly values of diurnal variation in departures from balance, corrected to 510 mm Hg, centered at the indicated 75th west meridian hours for 1946-1954 and at Greenwich mean hours for 1955. Tabulations are by months, seasons, and years, from days with complete records. Means for three groups of four months each are designated by Roman numerals, as follows: I, January, February, November,

[1] Tables 121 and 131 of this volume supersede Tables 125 and 136, respectively, of Volume XIV. Except for typographical errors, the discrepancies between corresponding tabular values arise from rounding off differences in computational procedures. Values in Tables 121 and 131 of this volume derive directly, without rounding off differences, from the tabulated bihourly means in this volume.

December; II, March, April, September, October; III, May, June, July, August. Tabular values are in units of 0.01 per cent of total cosmic-ray ionization, with 6.0 per cent added.

Table 141.—The tabular values give the total number of bursts in the indicated size interval, S, for each year at Huancayo. S is in units of 0.1 per cent of the total number of ions produced in one hour by cosmic rays. Thus a burst of 1.0 per cent contains about 2.7×10^7 ions. From 1936 through 1940 the size of bursts was measured in millimeters to the nearest 0.5 mm. From 1941 through 1955 the burst sizes were measured directly in units of 0.1 per cent of the total number of ions produced per hour by cosmic rays. Thus the number of bursts within a given size interval in millimeters is a function of the sensitivity. If $N(s_o)$ indicates the number of bursts of size greater than or equal to s_o, then $N(s_o)$ is found to be closely approximated by:

$$N(s_o) = \frac{C}{s_o^2},$$

with C a constant. Departures from this distribution law, at least within yearly samples, are probably not statistically significant. For a given scale value, e_o, in per cent per mm (determined principally by the electrometer sensitivity) the number of bursts (occurring in a given time interval T) in the size interval, s_1 mm to s_2 mm, is approximately:

$$\left[N(s_1) - N(s_2)\right]_{e_o} = C\left[\frac{1}{s_1^2} - \frac{1}{s_1^2}\right].$$

Let

$$\left[N(s_1) - N(s_2)\right]_{ke_o}$$

be the number of bursts which would have been expected (in the same time interval, T) in the size interval, s_1 mm to s_2 mm, if the scale value had been ke_o, per cent per mm; then

$$\left[N(s_1) - N(s_2)\right]_{ke_o} = \frac{C}{k^2}\left[\frac{1}{s_1^2} - \frac{1}{s_2^2}\right],$$

and

$$\left[N(s_1) - N(s_2)\right]_{e_o} = k^2\left[N(s_1) - N(s_2)\right]_{ke_o}$$

The last equation was used to estimate the expected number of bursts in given size intervals (in mm) for a constant scale value, $e_o = 0.200$ per cent per mm. The smallest size interval for which the number of bursts is tabulated in Table 141 for the period 1936 to 1940 is 0.50 per cent to 0.70 per cent. This corresponds to a size interval 2.5 mm to 3.5 mm for $e_o = 0.200$ per cent per mm. Normally the scale values remained essentially constant for periods of about two months. The range of scale values was from 0.186 to 0.239 per cent per mm, from 1936 through 1940.

Cheltenham Magnetic Observatory

Tables 142-367.—Monthly tables for the period March 1937 through December 1955 contain bihourly mean values of departure from balance, corrected to 760 mm Hg. Bihourly mean values are centered at the indicated 75th west meridian hours for Tables 142-355 (March 1937 through December 1954) and at the indicated Greenwich mean hours for Tables 356-367 (January through December 1955). Tabular values are in units of 0.1 per cent of total cosmic-ray ionization, with 10.0 per cent added.

Tables[2] 368-386.—Annual tables for the period 1937 through 1955 contain daily means of hourly departures from balance, corrected to 760 mm Hg. Tabular values, by months, are in units of 0.1 per cent of total cosmic-ray ionization, with 10.0 per cent added to obtain the tabulated values. Superscripts a to k indicate the number of missing bihourly values 1 to 11, respectively.

Tables[2] 387-405.—Annual tables for the period 1937 through 1955 contain bihourly values of diurnal variation in departures from balance, corrected to 760 mm Hg, centered at the indicated 75th west meridian hours, by months, seasons, and years, from days with complete records. Means for three groups of four months each are designated by Roman numerals, as follows: I, January, February, November, December; II, March, April, September, October; III, May, June, July, August. Tabular values are in units of 0.01 per cent of total cosmic-ray ionization, with 10.0 per cent added to obtain the tabulated values.

Christchurch Magnetic Observatory

Tables 406-414.—Annual tables for the period 1947 through 1955 contain daily means of hourly departures from balance, corrected to 29.00 in. Hg. Tabular values, by months, are in units of 0.1 per cent of total cosmic-ray ionization. Superscripts a to k indicate the number of missing bihourly values 1 to 11, respectively.

Tables 415-423.—Annual tables for the period 1947 through 1955 contain bihourly values of diurnal

[2] Tables 368 to 377 and Tables 387 to 396 of this volume supersede respectively Tables 143 to 152 and Tables 153 to 162 of Volume XIV. Except for typographical errors, the discrepancies between corresponding tabular values arise from rounding off differences between computational procedures. Values in Tables 368 to 377 and in Tables 387 to 396 of this volume derive directly, without rounding off differences, from the tabulated bihourly means in this volume.

variation in departures from balance, corrected to 29.00 in. Hg, centered at the indicated 172°.5 east meridian hours, by months, seasons, and years, from days with complete records. Means for three groups of four months each are designated by Roman numerals, as follows: I, January, February, November, December; II, March, April, September, October; III, May, June, July, August. Tabular values are in units of 0.01 per cent of total cosmic-ray ionization.

Godhavn Magnetic Observatory

Tables 424-427.—Annual tables for the period 1947 through 1950 contain daily means of hourly departures from balance, corrected to 760 mm Hg. Tabular values, by months, are in units of 0.1 per cent of total cosmic-ray ionization, with 13.0 per cent added to obtain the tabulated values. Superscripts a to k indicate the number of missing bihourly values 1 to 11, respectively.

Tables 428-431.—Annual tables for the period 1947 through 1950 contain bihourly values of diurnal variation in departures from balance, corrected to 760 mm Hg, centered at the indicated 45th west meridian hours, by months, seasons, and years, from days with complete records. Means for three groups of four months each are designated by Roman numerals, as follows: I, January, February, November, December; II, March, April, September, October; III, May, June, July, August. Tabular values are in units of 0.01 per cent of total cosmic-ray ionization, with 13.0 per cent added to obtain the tabulated values.

Corrected Tabular Values

Miscellaneous corrections of tabular values appearing in Carnegie Institution of Washington Publication No. 175, Volume XIV, are given on pages 438 to 441.

DECEMBER 1955

Bihourly Mean Values of Departures from Balance, +60, (in units of 0.1% of the total cosmic-ray ionization)
Corrected for Bursts and for Barometric Pressure to 510 mm Hg

Values Centered at Hours Indicated in First Row of Table----Greenwich Mean Time

Day	1h	3h	5h	7h	9h	11h	13h	15h	17h	19h	21h	23h	Sum	Mean				Day

COSMIC RAY RESULTS FROM CHELTENHAM MAGNETIC OBSERVATORY

JULY 1938

Bihourly Mean Values of Departures from Balance, +100, (in units of 0.1% of the total cosmic-ray ionization)
Corrected for Bursts and for Barometric Pressure to 760 mm Hg

Values Centered at Hours Indicated in First Row of Table--75° West Meridian Time

Day	1h	3h	5h	7h	9h	11h	13h	15h	17h	19h	21h	23h	Sum	Mean					Day

TABLE 279

COSMIC RAY RESULTS FROM CHELTENHAM MAGNETIC OBSERVATORY

AUGUST 1948

Bihourly Mean Values of Departures from Balance, +100, (in units of 0.1% of the total cosmic-ray ionization)
Corrected for Bursts and for Barometric Pressure to 760 mm Hg

Values Centered at Hours Indicated in First Row of Table--75° West Meridian Time

Day	1h	3h	5h	7h	9h	11h	13h	15h	17h	19h	21h	23h	Sum	Mean			Day

COSMIC RAY RESULTS FROM CHELTENHAM MAGNETIC OBSERVATORY

NOVEMBER 1950

Bihourly Mean Values of Departures from Balance, +100, (in units of 0.1% of the total cosmic-ray ionization)
Corrected for Bursts and for Barometric Pressure to 760 mm Hg

Values Centered at Hours Indicated in First Row of Table--75° West Meridian Time
