

WORLD DATA CENTER A for Solar-Terrestrial Physics

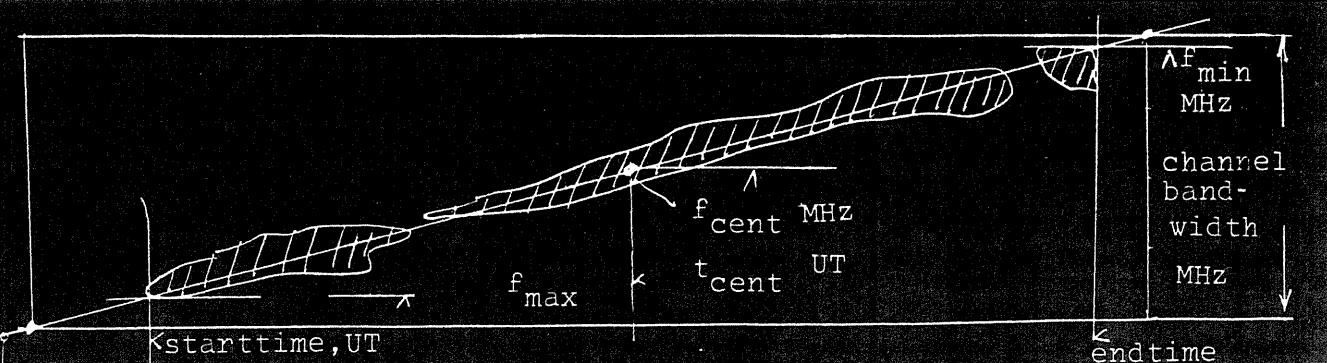

TYPE II SOLAR RADIO BURSTS
RECORDED AT WEISSENAU
1966-1987

February 1990

NATIONAL GEOPHYSICAL DATA CENTER

WORLD DATA CENTER A

National Academy of Sciences
2101 Constitution Avenue, NW
Washington, DC 20418 USA

World Data Center A consists of the Coordination Office
and the following nine Subcenters:

COORDINATION OFFICE

World Data Center A
National Academy of Sciences
2101 Constitution Avenue, NW
Washington, DC 20418 USA
Telephone: (202)334-3368

GLACIOLOGY (Snow and Ice)

World Data Center A: Glaciology
(Snow and Ice)
Cooperative Inst. for Research in
Environmental Sciences
University of Colorado
Boulder, Colorado 80309 USA
Telephone: (303)492-5171

MARINE GEOLOGY AND GEOPHYSICS

(Gravity, Magnetics, Bathymetry,
Seismic Profiles, Marine Sediment,
and Rock Analyses):
World Data Center A for Marine
Geology and Geophysics
NOAA, NGDC E/GC3
325 Broadway
Boulder, Colorado 80303-3328 USA
Telephone: (303)497-6487

METEOROLOGY (and Nuclear Radiation)

World Data Center A: Meteorology
National Climatic Data Center
NOAA, E/CC
Federal Building
Asheville, North Carolina 28801 USA
Telephone: (704)259-0682

OCEANOGRAPHY

World Data Center A: Oceanography
National Oceanographic Data Center
NOAA, E/OC
1825 Connecticut Avenue, NW
Universal Building, Room 409
Washington, DC 20235 USA
Telephone: (202)673-5594

ROCKETS AND SATELLITES

World Data Center A: Rockets and
Satellites
NASA/Goddard Space Flight Center
Code 630.2
Greenbelt, Maryland 20771 USA
Telephone: (301)286-7354

ROTATION OF THE EARTH

World Data Center A: Rotation
of the Earth
U.S. Naval Observatory
Washington, DC 20392-5100 USA
Telephone: (202)653-1529 or 1527

SEISMOLOGY

World Data Center A: Seismology
U.S. Geological Survey
Branch of Global Seismology
and Geomagnetism
Box 25046, Mail Stop 967
Denver Federal Center
Denver, Colorado 80225 USA
Telephone: (303)236-1500

SOLAR-TERRESTRIAL PHYSICS (Solar and

Interplanetary Phenomena, Ionospheric
Phenomena, Flare-Associated Events,
Geomagnetic Variations, Aurora,
Cosmic Rays, Airglow):
World Data Center A
for Solar-Terrestrial Physics
NOAA, NGDC E/GC2
325 Broadway
Boulder, Colorado 80303-3328 USA
Telephone: (303)497-6324

SOLID-EARTH GEOPHYSICS (Seismicity,

Earthquake Strong Motion, Tsunamis,
Gravimetry, Earth Tides, Recent
Movements of the Earth's Crust,
Magnetic Measurements, Paleomagnetism
and Archeomagnetism, Volcanology,
Geothermics):

World Data Center A
for Solid-Earth Geophysics
NOAA, NGDC E/GC1
325 Broadway
Boulder, Colorado 80303-3328 USA
Telephone: (303)497-6521

World Data Centers conduct international exchange of geophysical observations in accordance with the principles set forth by the International Council of Scientific Unions. WDC-A is established in the United States under the auspices of the National Academy of Sciences. Communications regarding data interchange matters in general and World Data Center A as a whole should be addressed to World Data Center A, Coordination Office (see address above). Inquiries and communications concerning data in specific disciplines should be addressed to the appropriate subcenter listed above.

H.W. Urbaz
Astronomical Institute of Tübingen University
Weissenau Station
7980 Rasthalde, Ravensburg, GFR

Description of the Lists and Legends

These Type II solar radio bursts are an improved list of the Weissenau Observatory Bulletin data. Preliminary data were also published in Solar-Geophysical Data (SGD) Part I "Solar Radio Emission Spectral Observations." The list was obtained by carefully reinspecting the film records. The films were viewed with a projecting magnifier device when the contrast of a projected image was sufficient. Otherwise an optical device was used. The film was put on an opaque glass strip for inspection and was illuminated on the reverse side and shifted by means of driving spools. Figure 1 shows both the devices in the laboratory at Weissenau Observatory.

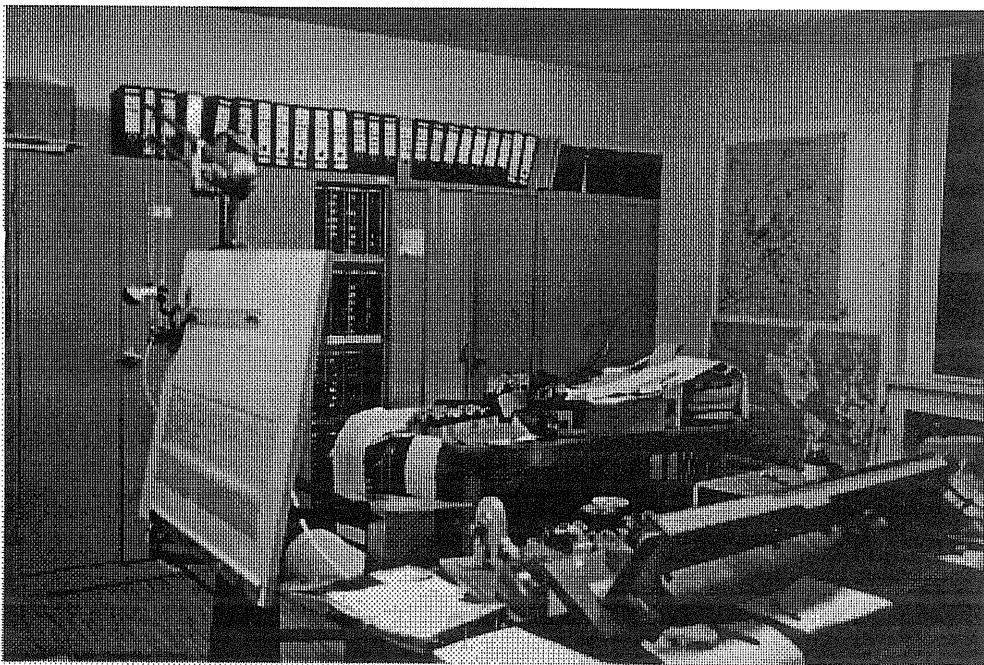

Fig 1. The magnifier projecting device. At the right a stripe of opaque glass may be illuminated from the rear side. The film is carried by this glass and shifted across the glass.

A list of solar cycle 20 Type II bursts was published by Krivsky and Lukac (1980). A list containing the events of solar cycle 21 was published by Robinson et al. (1983). Those data were obtained by the Dapto and Culgoora Observatory, Australia, while the list of Krivsky and Lukac depicts data of other Bulletins. The shock velocities were derived from the frequency drift assuming a proper density law [Meyer (1970); Gergely (1984); Robinson 1985].

The following is a description of all columns of the list. The user of this data list may obtain a crude image of a Type II emission band in the respective channels from the information of columns 3, 4, 5, 6, 7, 8, and 9:

Column 1: Year, day, month. An asterisk "*" indicates the film was analyzed on the simple optical device. Otherwise the projecting magnifier device was used.

Column 2: Burst types with terminology as in SGD Explanation of Data Reports Jul 1987. Bursts of other types are considered as associated to a Type II burst if they occur 30 minutes ahead or before the respective Type II bursts. The symbol II is used if there is only one emission band, which may be F (Fundamental) or H (Harmonic).

Columns 3,4: Start time t_{st} and end time t_{end} in UT. Refers to the earliest and latest burst feature seen on the film.

Columns 5,6: Start frequency, f_{st} , and end frequency, f_{end} , in MHz. If the burst feature is long enough in time duration, then a mid frequency is given.

Columns 7,8: f_{max} , f_{min} , in MHz. The maximum and minimum frequency of a burst feature occurring near the start and near the end of the burst (see Figure 2).

Column 9: Frequency drift $\Delta f / \Delta t$, in MHz/s. The frequency drift had to be determined separately in each channel, because channel bandwidth is higher by a factor of about 2 in the next higher channel. The same holds for the quantities given in columns 1 to 6. The parameters of our evaluation are shown in Figure 2. The frequency drift in MHz/s was determined as: (channel bandwidth)/ duration. The parameter duration is not included in the list. Duration was found from the difference between the time of the intersection of the channel boundary at the lower frequency side and the intersection of the channel boundary at the higher frequency side. Because the frequency scales are linear in each channel, the intersections were found by a ruler, optimally assigned to the emission band of the Type II burst that appears on film. The accuracies due to the sections determined in mm are: $\pm 2.5\%$ with the magnifier method and $\pm 3\%$ with a simple method. These accuracies are obtainable at smooth homogeneous regular emission bands. The practical obtainable accuracy is given by the distribution of the burst in the dynamic spectrum, i.e., the patchiness, irregular boundaries towards higher and lower frequencies. In this case the symbol "^" is applied prior to the value in the column. In cases of the merging into other burst types thereby masking the Type II emission band or of the overlap, the frequency drift cannot be given. There are a few cases of horizontal response or negative drift of an emission band. This is indicated in the remarks, Column 13. This feature may be a true feature of the emission but also may be due to an unequal distribution of brightness at one band edge. The frequency drift $\Delta f / \Delta t$ decreases with the decrease of the center frequency f_{cent} .

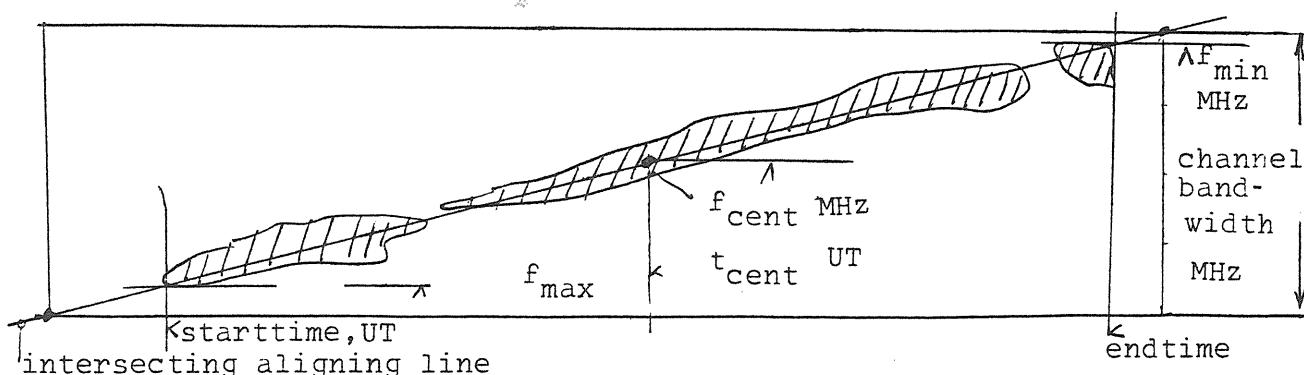

Fig. 2. Graphical display of the different columns given in the list.

Columns 10,11: Center frequency in MHz (f_{cent}) and t_{cent} , time of f_{cent} , gives the point of the dynamic spectrum where the frequency drift was determined. The emission band of a Type II burst may be fitted by a straight line as mentioned in Column 9, because the frequency drift is nearly constant over an octave, except in a few cases given in Column 13. f_{center} is in most cases equal to $f_{\text{start}} - 1/2(f_{\text{start}} - f_{\text{end}})$. The dynamic spectrum of other Observatories is nonlinear (exponential) in the f scale and the Type II bursts extending over several octaves show a curvature. In this case the tangent point gives the frequency to calculate the shock velocity and the frequency drift to be utilized is the slope $\Delta f / \Delta t$ of the tangent at that point.

Column 12: Bandwidth: 30-46-86-160-290-540-1000 MHz correspond to channel No. 1 to 6. Thus, Channel 1 = 30-46 MHz; Channel 2 = 46-86 MHz; Channel 3 = 86-160 MHz; Channel 4 = 160-290 MHz; Channel 5 = 290-540 MHz; and Channel 6 = 540-1000 MHz.

Column 13: Remarks: The time is given first, followed by the event to which it refers. Other different items are separated by a comma.

Explanation of symbols in the table:

- <46 : the true value is smaller than 46 but cannot be depicted from the film spectrum;
- 40-40 : both values in column f_{st} and f_{end} are the same. See for example on 21 April 1978. While f_{max} is larger than f_{min} naturally, this may be found at narrow bands with low frequency drift.
- $\wedge 0,012$: the given value is inaccurate: disturbed recording, failure of film processing, interference, etc.;
- : (horizontal short line): value cannot be depicted in principle due to similar reasons (see line above);
- empty space : irrelevant to give a value here.

Supplementary Burst List Information

The main list in this Report is a result of the re-inspection of the Weissenau burst list published in the Weissenau Bulletin and in SGD 1966 to 1987. In those preliminary lists all the bursts of Type II, IV, IIIGG-V and V were re-inspected to find Type II bursts not yet identified. Therefore, the corrected list here differs from the preliminary lists. It was impossible to look at all of the films from start to the end because this would take too many working hours. To detect some more unidentified Type II bursts the following procedure was performed. All the Type II bursts recorded by other Observatories operating during the Weissenau observation hours were checked to see if they were included in the Weissenau list. In 28 cases Type II bursts could be identified there. These additional bursts are presented in this Supplementary list. There were also cases of "no event" on the Weissenau record. The reason is the different recording intensities versus the frequency of the various instruments. The reverse situation was also found: other Observatories gave "no event" during their observation hours when such an event was given by Weissenau. These events are mentioned already in the main list.

Other Introductory Remarks

The data presented here are not homogeneous in the sense of being recorded by the spectrograph having the very same technical properties from 1966 to 1987. Since 1978, high gain LP antenna groups were employed in channels 1, 2, 3 increasing sensitivity. The effective contrast of the burst events as white features on more or less dark background changed considerably during the period of operation due to changes in the circuitry feeding the intensity input of the recording scope.

Moreover the features of the radio bursts were different in some respects in solar cycle 20 and cycle 21.

A copy of the film record of a Type II event may be obtained from the author at \$3.00 per 5 minute duration of event, plus a postal charge.
